

**B600 Tank Valves** in Stainless Steel

## Leading the world in pharmaceutical and biotechnology industry sterilisation processes

GEMÜ is one of the leading manufacturers of valves, measurement and control systems for sterile applications in the pharmaceutical and biotechnology industries. This position is based on GEMÜ's comprehensive investments in application-oriented research & development, amounting to more than 5% of the company's turnover. The versatile product range is supplemented with a wide range of advisory services provided by industry specialists and application experts.

## Customized solutions for your project business

GEMÜ provides the optimal solution from a single source. As a system supplier of isolation, actuator and control technology, we can respond very flexibly to your individual project-specific needs.

Our worldwide sales network provides fast reaction times, customer oriented service and a committed project management team.

# Description of use

Today tank valves are available in a large number of versions. They can be installed or welded into the tank cover, tank wall or tank bottom. Their main functions are for filling, sampling and draining the tank contents. Sometimes these functions are combined in one valve for reasons of process safety and sometimes even extra functions are added such as integrated CIP/SIP connections.

All these GEMÜ valves have one thing in common. They are diaphragm valves whose sealing weir is as close as possible to the tank wall to avoid deadlegs in the tank. The internal of the tank bottom valve body has a specially designed cavity which promotes optimum draining of the tank contents and improves their cleanability and sterilisation. Only this cavity ensures optimised draining of the tank.

#### **Features**

- Being very compact, the tank valves are ideal for applications where space is at a premium
- · Minimal deadlegs and optimized draining capabilities
- The valve body is machined from a single piece of block material (monoblock – no welded components)
- · CIP/SIP capable and sterilisable
- The internal surface contour of the valve body is available mechanically and/or electropolished down to Ra 0.25 μm
- · Optimised flow geometry
- Pipe connections such as butt weld spigots, clamps and threaded connections are available in accordance with industrial standards
- Valve body materials are 1.4435/316L, other alloys are available to customer specification or test requirements
- Welding into the tank bottom is simplified by a welding neck (standard 6 mm)
- Available with manual, pneumatic or motorized operators from the GEMÜ modular system
- Optical and/or electrical position indicators are available as actuator instrumentation

# GEMÜ B600 tank valves Overview of applications

#### CIP/SIP of the tank outlet

Tank bottom valve with welded on or integrated diaphragm valve. The welded on diaphragm valve is turned for optimized draining, if technically possible.

For design examples see pages 8-9.

## CIP/SIP of the tank or direct sampling from the tank

Tank bottom valve with welded on or integrated diaphragm valve. The welded on diaphragm valve is turned for optimized draining, if technically possible.

For design examples see pages 10-11.

### Venting valve

Tank valve with vertical outlet spigot. Available with additional welded on or integrated diaphragm valve depending on the version. The welded on diaphragm valve is turned for optimized draining, if technically possible. For design examples see pages 12-13.

### Tank outlet as ring main

Tank bottom valve with two outlet spigots for simple integration into a ring main.

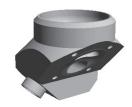

For design examples see page 14.

### Sterile sampling

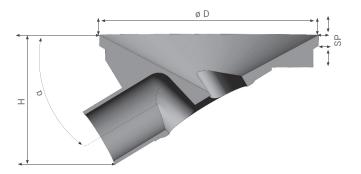

Tank valve with intergrated sampling option. Also available with integrated CIP/SIP function.

For design examples see pages 15-21.

# **Butt weld connections / Surface finish**

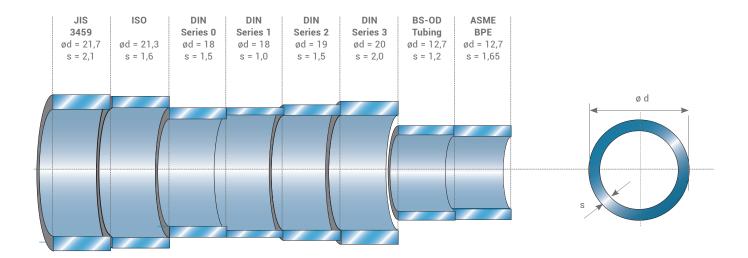

Modern, ergonomically shaped workstations and trained polishing staff give us the ability to provide high quality surface finishes. Depending on the required application, surface finishes from Ra 0.8 µm down to 0.25 µm can be achieved by polishing, electro polishing or a special process, we call "elysieren".

Mechanical hand polishing is carried out at our works to ensure our high quality standard.

# Clamp bodies

All clamp connections are machined according to the spigot dimensions e.g. to DIN 11850, EN ISO 1127, SMS 3008 or ASME BPE. We ask our customers to state which version or standard the connections shall comply with.

At GEMÜ all welds are carried out by specially qualified and certified welders utilising state-of-the art welding technology.

In principle, special connections requested by customers can be provided on GEMÜ M-blocks and it is also possible to have different connections on one body. Valve bodies with fully machined clamp connections are also possible as an option.

## Materials and certificates

Tank valves are produced at GEMÜ from block material. The most frequently used material is 1.4435 (316L) and 1.4435 BN2 with a ferrite content of < 0.5%. In addition, other common alloys such as 1.4539, Titanium, Alloy 59, Hastelloy C and special alloys are available by agreement

The table below provides an overview of the possible certificates which are generally available. The type of certificate and its content must be specified exactly before ordering to be able to provide the required documents. Later requests of certificates may not be possible or possible only under certain conditions.

Our specialists are happy to answer any questions you might have.

| Туре | Designation of the test certificate in accordance with EN 10204 | Content of the certificate                                                                      | Confirmation of the certificate by                                                                                                                                                              |

# Certificates and approvals

There is no universal diaphragm for all applications, hence we use different rubber mixtures and materials for our diaphragms. The different diaphragms have been certified according to their main fields of application so that we can certify conformity with the international regulations and rules below.

## FDA (U.S. Food and Drug Administration)

FDA Extraction according to 21CFR 177.2600 for elastomers and 21CFR 177.1550 for PTFE.

### **USP (United States Pharmacopeia)**

An independent institution has tested our diaphragms according to the regulations of the USP Class VI Chapter 87 In-Vitro and Chapter 88 In-Vivo. Furthermore, our diaphragms are free from animal ingredients.

#### **RoHS**

GEMÜ diaphragms comply with the RoHS Directive 2011/65 EC and the WEEE Directive 2002/96 EC.

### **Pressure Equipment Directive**

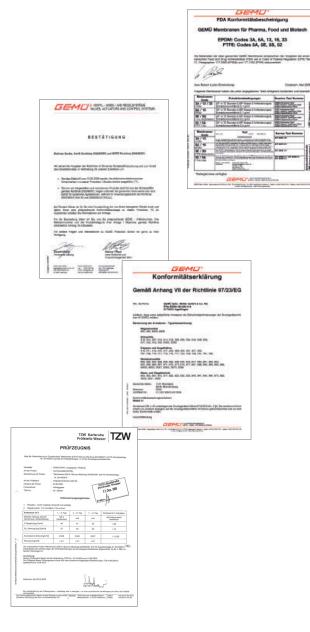

As all diaphragm valves are pressure bearing components and as the diaphragm is the central sealing element in addition to the valve body, all diaphragms also comply with the European Pressure Equipment Directive 2014/68/EU Art. 3 § 3. If no original GEMÜ shut-off diaphragms are installed, GEMÜ cannot accept any responsibility.

#### **EAC**

Certification of conformity with the standards, quality and safety standards of the customs union between Russia, Kazakhstan, Belarus, Armenia and Kyrgyzstan.

#### **EHEDG**

Hygiene standards in the foodstuff and beverage industry are continuously increasing and are approaching those of the pharmaceutical industry in sensitive areas. For this reason, the EHEDG was established some years ago (European Hygienic Engineering and Design Group). GEMÜ was the first diaphragm valve manufacturer worldwide to be granted certification for its diaphragm valve system. The examination took place in 2002.

# The original GEMÜ seal system

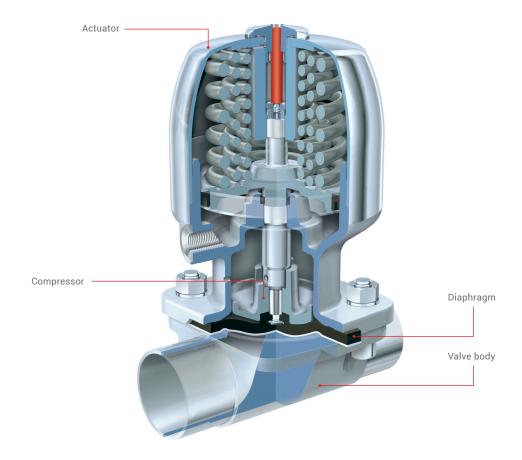

As a recognised diaphragm valve specialist, GEMÜ are familiar with almost all industrial sectors and applications. We are the leading supplier of stainless steel valves for aseptic and sterile applications in the pharmaceutical industry, biotechnology industry, as well as the foodstuff and beverage industries. As well as this, our valves also stand for reliability and a high standard of quality in the chemical and processing industries. The diaphragm, a central sealing element in the piping system is of major importance. Only the diaphragm and the valve body are in contact with the medium. At the same time, they also guarantee external hermetic sealing of the pipeline.

The system is more than the sum of the individual parts
The outstanding characteristics of the diaphragm valve
are the result of the perfect interaction of tuned components. These are the valve body, the shut-off diaphragm, the
diaphragm fixing, the compressor as well as the actuator.
Our many years of experience and intensive dialogue with
plant operators has enabled us to continue optimising the
diaphragm valve design and its individual components.

#### Diaphragm and valve body are "inseparable"

GEMÜ valve bodies have a raised circular sealing bead on the inside diameter, in contrast to the valve bodies of other manufacturers. This results in a defined sealing edge. This measure reduces the ring-shaped gap between diaphragm and valve body in the external sealing area. This special feature makes GEMÜ diaphragm valves suitable for sterile applications. We also consider this crucial design and functional characteristic, which was developed by GEMÜ more than three decades ago and constantly refined, during the development of our diaphragms. Only this ensures that our customers can rely on the valve as a complete unit.

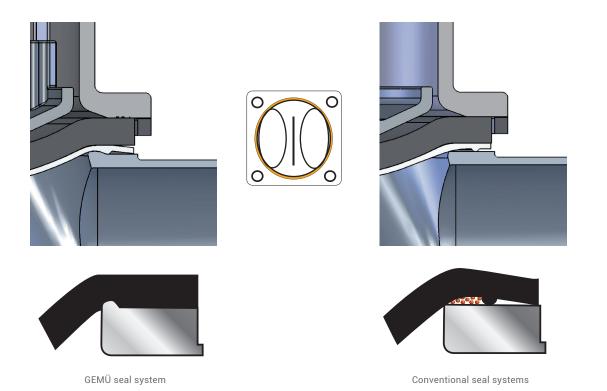

GEMÜ diaphragms have been developed, tested, and approved for applications with GEMÜ valve bodies. Therefore GEMÜ do not recommend or guarantee the use of other manufacturers diaphragms with GEMÜ valve bodies. We shall not accept any liability resulting from the use of diaphragms of other manufacturers inside GEMÜ diaphragm valves.

### Flexible diaphragm fixing

The diaphragm is uniformly fixed in the compressor by means of a threaded pin. The only exception is the smallest diaphragm size (diaphragm size 8), which is pushed in with a rubber pin. The uniform fixing method applies both to soft elastomer and PTFE diaphragms. The largest advantage of fixing by means of a threaded pin, e.g. in comparison to a bayonet fitting, is the even transfer of forces onto the large area of the flanks of the screw thread. This prevents damage to the mechanical connection between compressor and diaphragm especially under vacuum operating conditions. The uniform fixing of elastomer and PTFE diaphragms enables subsequent replacement of the diaphragm while using the same actuator.

# **GEMÜ diaphragms**

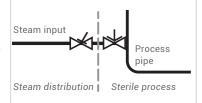

#### Selection

|           |                                                      | Diaphragm      | Temperature range [°C]<br>Liquid media |      |                                           |       |  |  |  |

| EPDM      | Ethylene-propylene-diene rubber                      | 8 - 100        | -10                                    | 100  | max. 150 °C ²<br>max. 180 min. per cycle  | 17    |  |  |  |
| PTFE/EPDM | Fully laminated PTFE diaphragm with EPDM back        | 8, 10, 100     | -10                                    | 100  | max. 150 °C ², no time limit<br>per cycle | 52/5A |  |  |  |
| PTFE/EPDM | Convex two-piece PTFE diaphragm with loose EPDM back | 25, 40, 50, 80 | -10                                    | 100  | max. 150 °C ², no time limit per cycle    | 5E    |  |  |  |

- <sup>1</sup> The sterilisation temperature is valid for steam (saturated steam) or superheated water.
- If the sterilisation temperatures listed above are applied to the EPDM diaphragms for longer periods of time, the service life of the diaphragms will be reduced. In these cases, maintenance cycles must be adapted accordingly. This also applies to PTFE diaphragms exposed to high temperature fluctuations.

PTFE diaphragms can also be used as moisture barriers; however, this will reduce their service life. The maintenance cycles must be adapted accordingly.

GEMÜ 555 and 505 globe valves are particularly suitable for use in the area of steam generation and distribution. The following valve arrangement for interfaces between steam pipes and process pipes has proven itself over time: A globe valve for shutting off steam pipes and a diaphragm valve as an interface to the process pipes.

Each application must be analysed before the selection of the diaphragm material. Since the most varied operating conditions often prevail within a plant at different locations, it can be necessary to use different valves and materials. In particular, the chemical characteristics and the temperature of the working media often lead to different interactions. The suitability of the materials used must therefore always be examined individually with regard to the current resistance list or checked by an authorised specialist. Only this procedure guarantees that the application will operate safely and economically for a longer period.

Diaphragms are wearing parts. They need to be regularly inspected and replaced otherwise malfunctions can occur, possibly resulting in hazardous situations. Please note: The maintenance intervals for inspecting and replacing diaphragms are application-dependent. In order to determine a suitable maintenance interval, the maintenance history and the stresses placed on the parts due to frequent sterilisation or frequent cycle duties must be taken into account.

#### Note

Since plastics and elastomers are subject to natural aging, we recommend observing the GEMÜ storage conditions for shut-off diaphragms. You thereby guarantee maximum storage and service life of the diaphragms.

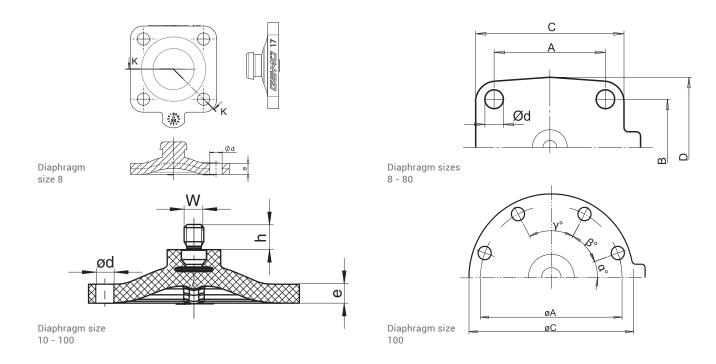

The temperatures specified above are merely the permissible temperature ranges for the respective diaphragm. The permissible temperature ranges of the valve must always be taken into account for the overall valve design. These can be found in the respective datasheets.

The temperature values are indicated irrespective of operating pressure and diaphragm size and apply to water and/or inert gases. When using water vapour or saturated steam, observe the steam pressure diagram.

Good resistance to solvents, chlorine, and aromatic hydrocarbons. | Convex two-piece diaphragm with loose PTFE face for higher switching cycles, can be used for permanent steam application.  Special compounding and production by GEMÜ. Special seal contour for external sealing on the bottom of the diaphragm. Low gas permeability. |  |  |  |  |  |

# Positioners and process controllers

#### Overview

GEMÜ pneumatic actuators can usually be paired with our electro-pneumatic positioners and process controllers.

In addition to the process parameters and the control system for which a positioner must be suitable, other technical functions and properties also play an important part in the selection of the right positioner.

To make your choice easier, we have placed the four GEMÜ positioners in a comparison based on important features.

# Combi switchboxes and electrical position indicators for pneumatically operated linear valves

Our devices detect the valve stroke in any installation position without play and are tension-free. The sensor base of the GEMÜ 1234, 1235 and 4242 series is positively connected to the valve spindle by means of a preloaded spring so that possible tangential forces of the valve actuator do not negatively affect the position indicator. The position indicators can be quickly and easily assembled and are safe and uncomplicated to handle.

They can be adapted to pneumatic actuators of GEMÜ globe and diaphragm valves. Due to its special design, the GEMÜ 9415 quarter turn actuator may likewise be combined with this type of position indicator.

# GEMÜ B600 tank valves

## **Specification**

The enormous consequential costs which may be incurred as a result of errors in the planning of production plant more than justify increased planning efforts. Delays and extra costs in validation, late commissioning, contaminated batches, later modifications to the plant are just a few of the points in favour of precise planning.

Good planning of the valve designs begins in the project stage. The implementation of complex process sequences demands a wide variety of compact valve designs. GEMÜ places great emphasis on ensuring you get the optimum tank valve for your specific application and not any standard solution from the catalogue. It is therefore important that you give us all the relevant information in the project phase. The GEMÜ specification sheet is a great help here.

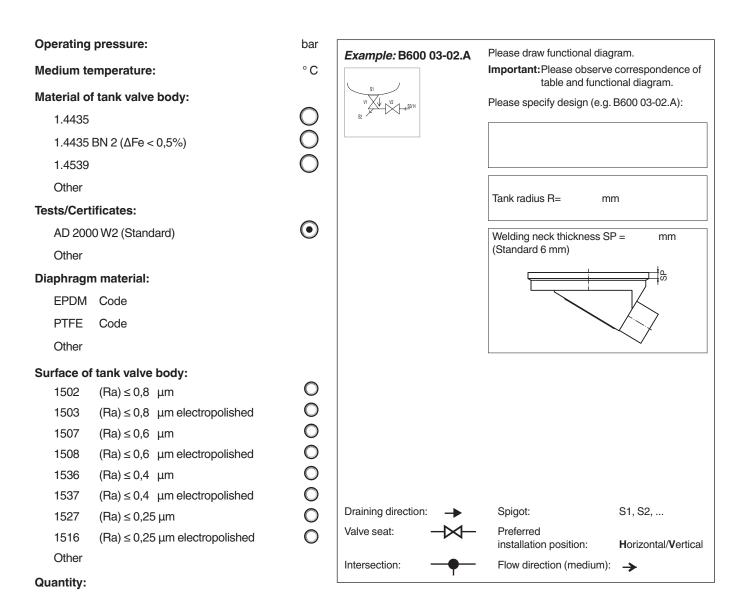

Please use only one form for each tank valve and proceed as follows to fill in the specification:

- 1. Enter the operating conditions and desired materials.
- 2. Please state what functions the tank valve should fulfil. Draw a pictogram or functional diagram and insert it in the specification. You can of course use the examples shown in this brochure as a quide.
- 3. Label all connection spigots starting with S1, all valve seats starting with V1.
- 4. Assign the necessary features to every connection in the table and and add explanatory remarks where necessary.
- 5. Specify the necessary operator and type as well as control function for every connection.
- 6. For extra remarks and descriptions, you can use an additional sheet.

# Specification of B600 tank valves

Please complete this form and return it to your nearest GEMÜ office or to the address listed below!

| Spigot     |    | Pipe co | nnection  |        |               |                | Operator         |               | Other               |  |
